## **ABSTRACT**

internal combustion system for an control engine having a variable valve operating mechanism capable of varying at least one of a valve lift and an operation angle of an engine valve continuously is The control system comprises a detecting provided. device that detects an operating condition of variable valve operating mechanism and produces signal representative thereof, and a controller that controls the operating condition of the variable valve 10 operating mechanism in response to the signal from the The controller is programmed to detecting device. determine whether an operation responsiveness of the variable valve operating mechanism is lowered based on from the detecting device signal 15 of the variable valve characteristics operational operating mechanism when the operation responsiveness of the variable valve operating mechanism is lowered. A control method is also provided.
